

HINZ MEDICAL FOODS™

For the specific dietary management of:

Hyposerotonergic™ conditions
Hypodopaminergic™ conditions
Hypoglutathionemia™ conditions

The monoamines are serotonin, dopamine, norepinephrine, and epinephrine

The only way to increase the synthesis of serotonin, dopamine, and glutathione in the central nervous system and the peripheral system is by administering the required nutrients.

When the differential diagnosis suggests dietary needs to address

hyposerotonergic conditions (low serotonin)
hypoglutathionemia conditions (low glutathione)
hypodopaminergic conditions (low dopamine)

Consider R&R
